### Schuckers | Computational Methods in Biometric Authentication

Biometric authentication is the process of comparing data for the person's characteristics to that person's biometric "template" to determine resemblance. The reference model is first stored in a database or a secure portable element like a smart card. The data stored is then compared to the person's biometric data to be authenticated.

### Biometrics: authentication & identification (definition ...

Biometric authentication works by comparing two sets of data: the first one is preset by the owner of the device, while the second one belongs to a device visitor. If the two data are nearly identical, the device knows that "visitor" and "owner" are one and the same, and gives access to the person.

The block diagram illustrates the two basic modes of a biometric system. First, in verification (or authentication) mode the system performs a one-to-one comparison of a captured biometric with a specific template stored in a biometric database in order to verify the individual is the person they claim to be. Three steps are involved in the verification of a person.
