An intrusion detection system (IDS) is a device or software application that monitors a network or systems for malicious activity or policy violations. Any intrusion activity or violation is typically reported either to an administrator or collected centrally using a security information and event management (SIEM) system.

Intrusion detection system - Wikipedia

Network-based intrusion-detection systems scrutinize all packets on a network segment, flagging those that look suspicious. A network IDS searches for attack signatures - indicators that the...

An intrusion detection system, IDS for short, monitors network and system traffic for any suspicious activity. Once any potential threats have been identified, intrusion detection software sends notifications to alert you to them. The latest IDS software will proactively analyze and identify patterns indicative of a range of cyberattack types.

Network-based intrusion detection, also known as a network intrusion detection system or network IDS, examines the traffic on your network. As such, a typical NIDS has to include a packet sniffer to gather network traffic for analysis. The analysis engine of a NIDS is typically rule-based and can be modified by adding your own rules.

The Cisco Network IDS solution set includes appliance-based intrusion detection through the Cisco 4200 line of sensors. Ranging from performance options between 45 Mbps to 1 Gbps, the 4200 series offers multiple options for security administrators and can be quickly and easily integrated into network environments.

Intrusion Detection - an overview | ScienceDirect Topics

The traditional network intrusion detection methods have the problem of long distance dependency. It is easy to ignore contextual information. Moreover, the current data dimension is too high and the feature extraction process is complex, which is not conducive to the requirements of real-time and accuracy of intrusion detection.

An Intrusion Detection System (IDS) is yet another tool in the network administrator's computer security arsenal. It inspects all the inbound and outbound network activity. The IDS identifies any suspicious pattern that may indicate an attack the system and acts as a security check on all transactions that take place in and out of the system.

Network Design: Firewall, IDS/IPS - Infosec Resources

A network intrusion is any unauthorized activity on a computer network. Detecting an intrusion depends on the defenders having a clear understanding of how attacks work. In most cases, such unwanted activity absorbs network resources intended for other uses, and nearly always threatens the security of the network and/or its data.
