Traditionally, natural gas parameters are expressed in mass such as Btu/lb. or MJ/kg. Note that gases behave differently at different temperatures and pressures, i.e., gas densities vary with respect to changes in pressure and temperature.

DETERMINING NATURAL GAS PARAMETERS EXPRESSED IN VOLUME

If we wish to express the concentration in parts-per-million or ppm, the ratio is simply multiplied by 1 million instead of 100. Since the properties of gases are greatly affected by temperature and pressure, it is only natural that any parameter to express concentration would be a RATIO OF LIKE UNITS—whether. Volume of a component / total volume

Using Common Sense and Science in Expressing Gas ...

Introduction. Natural gas plays a very important role in our society as a raw material for a great variety of industrial processes. Its utilization as primary energy source has been consolidated during the past few decades due its high hydrogen/carbon ratio, efficient combustion, and lower amount of contaminants in the exhausted gases, including lower carbon dioxide emissions.

The research of some scholars at home and abroad focuses on the physical parameters and development index of the CO₂ contents in natural gas [7, 9–14], but seldom focus is directed on the phase behavior of natural gases with high CO₂ content and the phase behavior of natural gas with high CO₂ content is not entirely clear at present [15–19].

Phase Behavior and Physical Parameters of Natural Gas ...

The gas composition is representative for the transmission system examined in the case studies following. The range of pressure and temperature conditions is characteristic for natural gas industry (i.e. 0.1–25 MPa, –20–90 degC, which corresponds to the reduced pressure and temperature ranges 0.02–5.5 and 1.3–1.9, respectively.)

The chapter concludes in Section 10.10 with a discussion of key gas market parameters in the report and proxy natural gas supply curves from the new integrated model based on results in EPA Base Case v.4.10. The proxy curves are meant to provide a point of comparison with the natural gas supply curves used in previous EPA IPM base case.

The water vapour content of natural gas in the Enbridge Gas system is less than 65 mg/m³, and is typically 16 to 32 mg/m³. Typical combustion properties of natural gas: Note that there is no guarantee that the combustion properties at your location will be exactly as shown. The properties shown are an overall average on the Enbridge Gas system.

Note: Dry natural gas is also known as consumer-grade natural gas. The parameters for measurement are cubic feet at 60 degrees Fahrenheit and 14.73 pounds per square inch absolute. Also see Natural gas. Dry natural gas production: The process of producing consumer-grade natural gas. Natural gas withdrawn from reservoirs is reduced by volumes used at the production (lease) site and by processing losses.
