Sheet Metal Stamping Design Guidelines

(1) Stamping is carried out at room temperature, that is, it does not require heating, so it is called cold stamping. (2) The objects of stamping processing are all sheets, so it is also called sheet metal stamping. (3) Stamping is done by equipment and molds. It needs three elements: punch (equipment), mold, and raw materials.

Design for Deep Drawing Sheet Metal Stamping, DFM Deep drawing Metal Stamping manufacturing technology is defined as the stretching of sheet metal stock, commonly referred to as a blank, around a plug. The edges of the metal blank are restrained by rings and the plug is drawn into a top die cavity to achieve the end shape that is desired.

Design for Deep Drawing Sheet Metal Stamping | Engineers Edge

Metal stamping is a cold-forming process that makes use of dies and stamping presses to transform sheet metal into different shapes. Pieces of flat sheet metal, typically referred to as blanks, is fed into a sheet metal stamping press that uses a tool and die surface to form the metal into a new shape.

What is Metal Stamping? A Guide to Processes, Steps and ...

Other guidelines to remember when the processing draw reductions are: Design open-ended draw cavities for draw depth adjustment. Once the proper draw ratio is achieved, metal will flow and the part can be drawn partially or completely off the binder. After the first draw, the blank diameter should not change.

When the manufacturing team and component design team work together, the result is the best design for manufacturing—and sometimes a component stamping cost savings of as much as 50 percent. Why manufacturing and component design teams don't collaborate on each job is inexplicable.

□ Avoid large sheet metal parts with small bent flanges. □ In low carbon steel sheet metal, the minimum radius of a bend should be one-half the material thickness or 0.80 mm (0.03 inch), whichever is larger. □ Bends specified as angles may be toleranced at plus or minus one-half degree at a location adjacent to the bends.

Hems are used to create folds in sheet metal in order to stiffen edges and create an edge safe to touch. For tear drop hems, the inside diameter should be equal to the material thickness. For open hems, the bend will lose its roundness when the inside diameter is greater than the material thickness.

Importance of the K-factor in sheet metal design. The K-factor is used to calculate flat patterns because it is related to how much material is stretched during bending. Therefore it is important to have the value correct in CAD software. The value of the K-factor should range between 0 - 0,5.
